
sphinx raw external file in preformatted style

Posted by Jean Daniel - 2009/09/10 17:27

Hello, I would like to include in my pdf an external file. It is some text which should not be interpreted, just included as is preferably in preformatted style. The documentation seems to say this is the way: `.. raw:: html :file: inclusion.html` <http://docutils.sourceforge.net/docs/ref/rst/directives.html#raw-data...> So I tried `.. raw:: latex :file: mytext.txt` But I do not know how to tell the Writer to include it as preformatted. Do you know how to do that? Thanks for your help,

Hello, I would like to include in my pdf an external file. It is some text which should not be interpreted, just included as is preferably in preformatted style. The documentation seems to say this is the way: `.. raw:: html :file: inclusion.html` <http://docutils.sourceforge.net/docs/ref/rst/directives.html#raw-data...> This is the way to include something that is already in the end-format of your document. I suppose you want to ``include a file as literal block`` `__::` `.. include: inclusion.txt :literal: __` <http://docutils.sf.net/docs/ref/rst/directives.html#including-an-exte...> Günter

If you're using sphinx, how about the ``literalinclude`` directive? <http://sphinx.pocoo.org/markup/code.html> The literal include is indeed very featureful, I'll need this for python code. Thank you. I am not sure I am happy there are two commands though. Maybe I wish the standard include had all the feature or maybe sphinx could have extended the same directive. Cheers
